

Capstone Project: Existing Customer Credit Limit Review Assistant

Problem Statement

While providing a credit card, you assess the customer once, at onboarding. In real life, the credit limit is rarely checked again. A customer whose finances got worse still has the old limit, say ₹2 crore. A customer who always pays on time stays stuck at ₹20 lakh.

Build a multi-agent AI assistant that reviews the credit limit of an existing customer and recommends Increase, Maintain, Reduce, or Suspend. All amounts are in ₹ (INR).

Tasks

Task 1: Review agents

- Financial agent: reads the last two years of financials and calculates Current Ratio ($\text{Current Assets} \div \text{Current Liabilities}$), Debt-to-Equity ($\text{Total Debt} \div \text{Equity}$), and Net Profit Margin ($\text{Net Profit} \div \text{Revenue} \times 100$).
- Policy agent: uses RAG on a credit policy PDF (Azure AI Search) to find the matching rule, then recommends the action and new limit, citing the rule.

Task 2: Manager approval

- A Copilot Studio flow sends every Reduce or Suspend decision to a manager to approve or reject.

Edge Cases (optional)

Find at least 2 real-world edge cases yourself (for example, missing data or a bad file). Decide what the assistant should do. If it is unsure, it must say so and send the case to a human.

Data

Create your own, with no real customer data a short credit policy PDF with ₹ limits.

Deliverables

- Public Google Drive folder with code, policy PDF, data, and README
- PPT with architecture and workflow
- Screenshot of the working application showing the agent's input data and output
